

Overview

The CDM-570-IPEN and the CDM-570L-IPEN are IP-centric satellite modems with data encryption that provide industry leading performance and flexibility in a 1RU package.

With their innovative architecture and support for advanced capabilities, CDM-570-IPEN and CDM-570L-IPEN allow for efficient IP networking and transport over satellite links while supporting a wide range of applications and network topologies. In addition to the 10/100Base-T Ethernet interface, a wide range of data interfaces are available to support legacy applications and assist in migrating from legacy to IP transport. The advanced FPGA-based architecture along with the internal Flash memory allows for easy field upgrades via the Ethernet port.

For cellular backhaul, the CDM-570-IPEN and CDM-570L-IPEN also offer E1 RAN Optimization as an option.

Features

- Data rate range from 2.4 kbps to 9.98 Mbps
- CDM-570-IPEN: 50 to 90 or 100 to 180 MHz IF range
- CDM-570L-IPEN: 950 to 2000 MHz IF range
- Integrated IP Module with 10/100Base-T Ethernet port
- Static IP routing for unicast and multicast
- Multi-level Quality of Service (QoS)
- Header and payload compression for maximum efficiency
- 3xDES Encryption for transport security
- Standards based management via SNMP, Web, or Telnet
- IGMP v1 and v2
- VLAN capability with 802.1Q compliant QoS
- Symmetric as well as asymmetric operation for maximum bandwidth efficiency
- Support for mesh, star and hybrid network topologies
- Vipersat Management System (VMS) integration
- G.703 clock extension for IP backhaul (option)

Fast acquisition demodulator

- Modulation types: BPSK, QPSK, OQPSK, 8-PSK, Patented 8-QAM (U.S. patent 7,254,188), 16-QAM
- Forward Error Correction (FEC) choices include Turbo Product Code (TPC), Viterbi, Reed-Solomon, and Trellis Coded Modulation (TCM)
- Automatic Uplink Power Control (AUPC)
- Embedded Distant-end Monitor and Control (EDMAC)
- 1:1 Redundancy available
- CDM-570-IPEN: FSK communications to CSAT-5060 or KST-2000A
- CDM-570L-IPEN: 10 MHz reference for BUC, FSK communications and optional BUC power supply
- CDM-570L-IPEN: 10 MHz reference and power supply for LNB
- E1 RAN Optimization (option)

Typical Users

- Enterprise
- Internet Service Providers
- Satellite Service Providers
- Offshore & Maritime
- Mobile Operators

Common Applications

- Cellular Backhaul
- Communications onthe-Move
- Disaster Recovery & Emergency Communications
- Enterprise
- Offshore & Maritime Communications
- Satellite News Gathering

Integrated IP Capability

With their innovative architecture and support for advanced capabilities, CDM-570/L-IPEN allows for efficient IP networking and transport over satellite. CDM-570/L-IPEN supports a wide range of applications and network topologies.

Data Encryption

Configurable on a per route basis, the modems supports 3xDES data encryption for transmission security to prevent unauthorized access to data transmitted over the satellite link.

Header Compression (Option)

Configurable on a per route basis, header compression reduces the bandwidth required for VoIP by as much as 60%. Example: A G.729 voice codec, operating at 8 kbps, requires 32 kbps bandwidth once encapsulated into an IP/UDP/RTP frame. With compression, the same voice call needs only 10.8 kbps total WAN satellite bandwidth. Typical Web/HTTP traffic can also be reduced by 10% via IP/TCP header compression.

Payload Compression (Option)

Configurable on a per route basis, payload compression can reduce the required satellite bandwidth by up to 40%.

Quality of Service (QoS) (Option)

The modems supports multi-level QoS to reduce jitter and latency for real time traffic, provides priority treatment to mission critical applications and allows non-critical traffic to use the remaining bandwidth. Supported modes are:

- DiffServ Industry-standard method of providing QoS enabling seamless co-existence in networks that implement DiffServ.
- Max/Priority Provides eight levels of traffic prioritization with the ability to limit maximum traffic per priority class
- Min/Max Provides a Committed Information Rate (CIR) to each user defined class of traffic with the ability to allow a higher burstable rate depending on availability

Turbo Product Coding

The optional Turbo Product Codec delivers significant performance improvement when compared to Viterbi with concatenated Reed-Solomon. It offers increased coding gain, lower decoding delay, and significant bandwidth savings compared to traditional FEC.

Management

The modems support SNMP, web-based and command line interfaces for management. The modems can also be configured and monitored from the front panel, or through the remote M&C port (for non-IP mode of operation). Ten complete RF configurations may be stored in the modems. An event log stores alarm and status information in non-volatile RAM, while the link statistics log stores link performance (Eb/No and AUPC performance) for monitoring and reporting purposes.

E1 RAN Optimization (Point-to-Point)

Comtech EF Data's RAN Optimization technology significantly reduces the WAN (satellite) bandwidth required to carry an E1 bearer used for cellular backhaul. It provides the user complete control over the desired level of optimization and link quality. Depending on the traffic profile, typical bandwidth reduction of 30-35% can be achieved with little or no impact to the voice quality. The WAN bandwidth can be reduced by as much as 60% relative to the ingress data rate, allowing users to achieve desired bandwidth savings and voice quality. The CDM-570/L-IPEN provides usage statistics to assist with link monitoring. E1 RAN optimization cannot be used simultaneously with the IP Module.

G.703 Clock Extension

Cellular networks require precise synchronization of base stations, which is a challenge when using IP backhaul. Most operators are forced to use GPS-based external equipment for site synchronization. CDM-570/L-IPEN offers a G.703 clock extension option that propagates a high stability reference from hub to the remote. This process does not require additional bandwidth.

EDMAC & AUPC Operation

The CDM-570/L-IPEN has the ability to monitor and control the distant end of a point-to-point satellite link using EDMAC or EDMAC2. User data is framed and bits are added to pass control, status, and AUPC information. AUPC can be used to automatically adjust the transmit power based on the Eb/No feedback from the distant end modem. EDMAC operation is transparent to the user.

FAST Feature Enhancements

The FAST codes make it easy to upgrade the modem capability in the field. New features can be added on site, using FAST access codes purchased from Comtech EF Data that can be entered via the front panel.

Vipersat Management System

- · Dynamic SCPC carrier allocation & true bandwidth-on-demand
- User-defined policies for upstream carrier switching
- Star and full mesh capabilities using single hop on-demand
- Advanced switching takes advantage of using other modulation/forward error correction combinations
- Guaranteed bandwidth capability

VMS Network & Bandwidth Management

A Vipersat-powered network integrates these advanced modems with a powerful network management tool, the Vipersat Management System (VMS). In addition to the traditional monitoring and control of the CDM-570/L-IPEN modems and the CDD-564/LEN and CDD-562LEN demodulators, the VMS allows these devices to share bandwidth, and when needed, switch automatically to a dedicated SCPC channel.

In a Vipersat-powered network, the CDM-570/L-IPEN modem takes advantage of its fast acquisition demodulation to allow it to operate in a shared mode. Inbound transmissions (from remote to hub) can be switched from a shared Selective Time Division Multiple Access (STDMA) mode to a dedicated Single Carrier Per Channel (SCPC) connection via a variety of user defined policies or triggers. This enables the network to more effectively handle real-time connection-oriented applications and reduces both latency and network congestion. Through VMS, dynamic point-to-point mesh connections can also be established between remotes.

Upstream Switching

Through protocol classification in the remote terminals, the modem initiates automatic switching. VMS establishes dSCPC bandwidth based on policies that can be individually enabled on a per-remote basis, or globally enabled. Policies can be configured for a variety of applications such as VoIP, video (VTC), or based on a load, or via a schedule, Type of Service (ToS), or QoS rules such as IP port or IP

address and protocol type. Operators are able to set minimum and maximum data rates for each remote, as well as excess data rates for an initial upstream switch.

Vipersat Operation Mode

Vipersat operation is enabled via a FAST feature code. Networks can initially be deployed in fixed point-to-point or point-to-multipoint configurations. As the network grows and users wish to take advantage of the bandwidth on-demand savings by implementing a Vipersat network, modems can easily be upgraded to Vipersat mode. Vipersat mode provides for the ability to operate in the following modulation/FEC rates:

STDMA	QPSK, Rate 3/4 Turbo FEC – all STDMA modes Data Rate Range: 64 kbps – 4.5 Mbps BPSK, Rate 5/16 Turbo FEC – Entry Channel Mode only
	Data Rate Range: 32 kbps to 937 kbps
SCPC	All Turbo Product Code FEC rates as detailed in the following specifications

Specifications

Specifications	1
Frequency Range	CDM-570-IPEN: 50 to 90 or 100 to 180 MHz, 100 H

Modulator

	CDM-570-IPEN	CDM-570L-IPEN	
Frequency Stability	± 1 ppm, 0° to 50°C (32° to 122°F)	±0.06 ppm, 0° to 50°C (32° to 122°F)	
Output Power	0 to -25 dBm, 0.1 dB steps	0 to -40 dBm, 0.1 dB steps	
Accuracy	± 0.5 dB over frequency and temperature	± 1.0 dB over frequency and temperature	
Phase Noise	< 0.75 degrees RMS double-sided, 100 Hz to 1 MHz	< 1.2 degrees RMS double-sided, 100 Hz to 1 MHz	
Output Spectrum/ Filtering	Meets IESS-308/-309 power spectral mask		
Harmonics and Spurious	< -55 dBc/4 kHz (Typically < -60 dBc/4 kHz)		
Transmit On/Off Ratio	55 dB minimum		
External TX Carrier Off	By TTL LOW signal, or RTS		
TX Clock Options	Internal (SCT), external (TT), loop timing with symmetric or asymmetric operation (Data interface dependent)		

Demodulator

Demodulator			
	CDM-570-IPEN	CDM-570L-IPEN	
Input Power Range	-30 to -60 dBm	-130 + 10 log symbol rate, dBm (minimum) -90 + 10 log symbol rate, dBm (maximum)	
Max Composite Level	+35 dBc, up to -5 dBm absolute max.	+40 dBc, up to -10 dBm absolute max.	
Acquisition Range	± 1 to ± 32 kHz, 1 kHz step	± 1 to ± 32 kHz, 1 kHz step, symbol rate <= 625 ksps ± 1 to ± 200 kHz, 1 kHz step, symbol Rate > 625 ksps	
Acquisition Time	Highly dependent on data demodulator acquisition ra 120 ms average at 64 kbp acquisition sweep range, 6	inge. Example: s, Rate 1/2 QPSK, ± 10 kHz	
Receive Buffer	512, 1024, 2048, 4096, 81	82, or 16384 bits	
Receive Clock Options	Buffer disabled (RX satellite), buffer enabled (symmetric or asymmetric operation) (data interface dependent)		
Clock Tracking	± 100 ppm minimum		
Monitor Functions	E _b /N _o , frequency offset, BE signal level	ER, buffer fill status, RX	

Example BER Performance

For symbol rates up to 2.5 Msps (See user's manual for higher symbol rates). Guaranteed E_b/N_o , in dB (typical values in parentheses) with two adjacent carriers 7 dB higher. (See the user's manual for a complete listing of the performance of all FEC types, code rates, and modulation types.)

Viterbi
